Okey 101 Project Explanation

05 February 2026 19:39

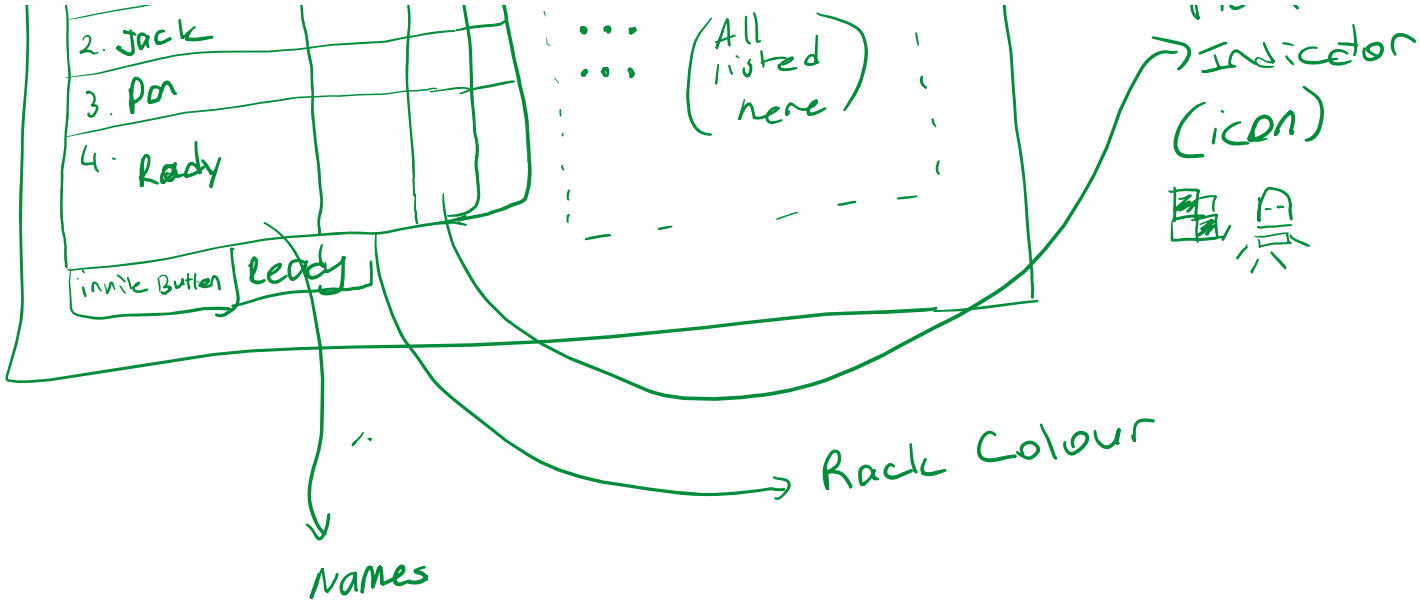
This noting is spesificdly made by Alperen ÖNCÜL in order to design my new Okey 101 game for Android & Windows.

These designs will help as gents to undorestend my uisier.

The Ut in the game will be minimal. Go âme ne progress:

Game Process and mechanics will be explained below.
The full game progress as follows.

1. First player creates the session, with unique id and session name. (PRE-GAME LOBBY)



Player 1 can invite his friends or add bots. For inviting friends Player presses invite button.

After inviting, players can choose their rack colours. It doesnt effect their gameplay (they will still see their rack according to their chosen theme) but it effects their way of seeing each others's racks on the board. For example, player 1 chooses light blue, and other players will see its rack on the blue color.

Player 1 can choose the game mode and rules, like if it is

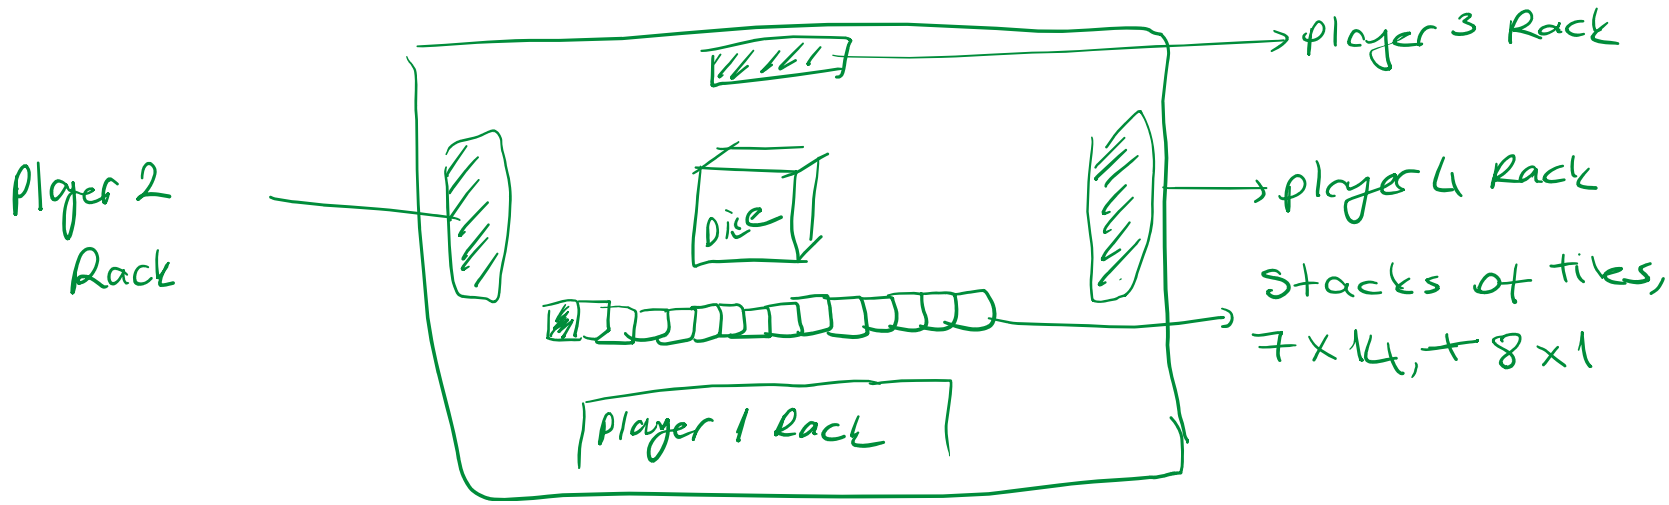
Player 1 can choose the game mode and rules, like if it is normal okey, 101 okey rule, 51 okey rule, round timers, penalties etc.
Every change made here refreshes the ready status for all players.

After every player presses ready button, game commences.

---

2. Starting the game

Game commences with a single dice on the screen.



| Player 1 Rack |

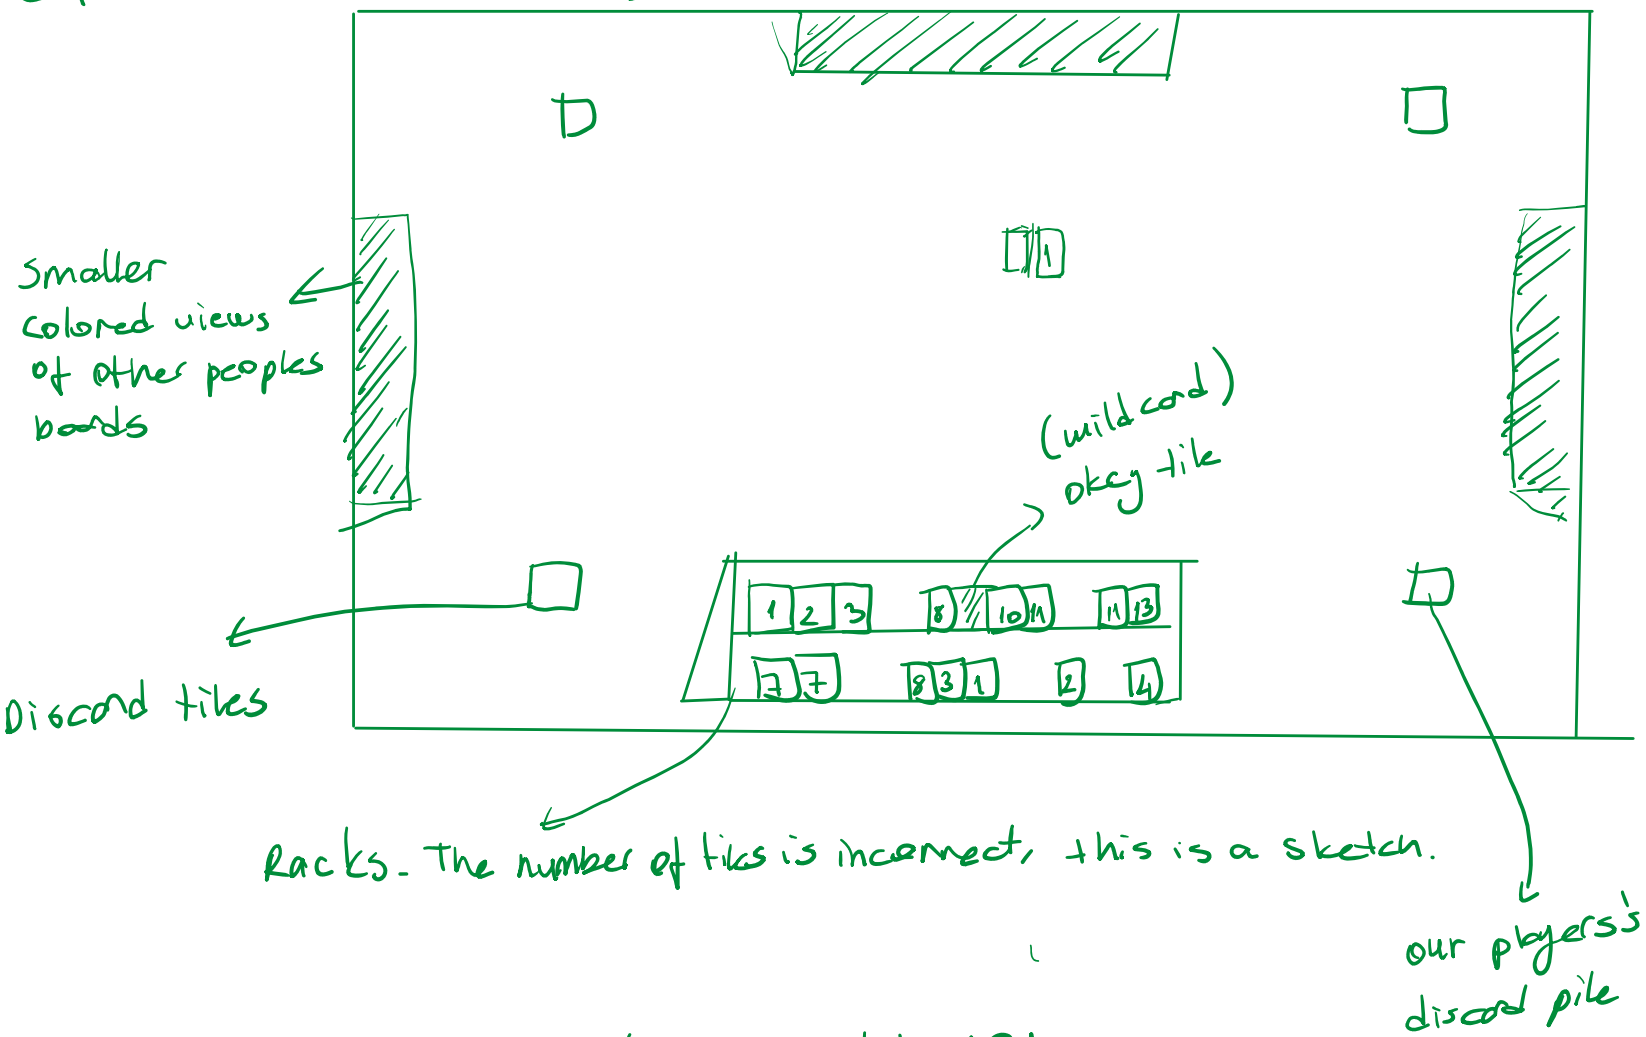
Players, starting from Player 1 throws their dice by pressing the dice one by one. Player who throws the biggest dice is the dealer. It throws two more dices. First one to select stack of tiles, second one to select individual tile on that stack. The coosen tile is our okey tile identificator (+1 number higher is the okey tile itself). By this way, dealer (who threw the highest dice earlier) indirectly choose the okey Tile (Wildcard tile). Identificator tile is now sets open on top of its stack. 1 tile from 8x1 stack moves right beside indentificator tile. Then dealing begins by computer. Newly made 8x1 stack (that sits right beside identicator tile now) goes to the person on dealers right. It gets 8x1 stack, then passes 3 stacks and gets the next one, then passes 3 and gets the final stack. So in the

the next one, then passes 3 and gets the final stack. So in the end he gets 22 tiles total. Second player gets the now closest right one to the identicator (since the upmost left one dealed to the other person), 3 pass and gets one stack, 3 pass and gets its final one, like the first player. This goes on after all players get their stacks, totaling to 22,21,21,21 tiles.

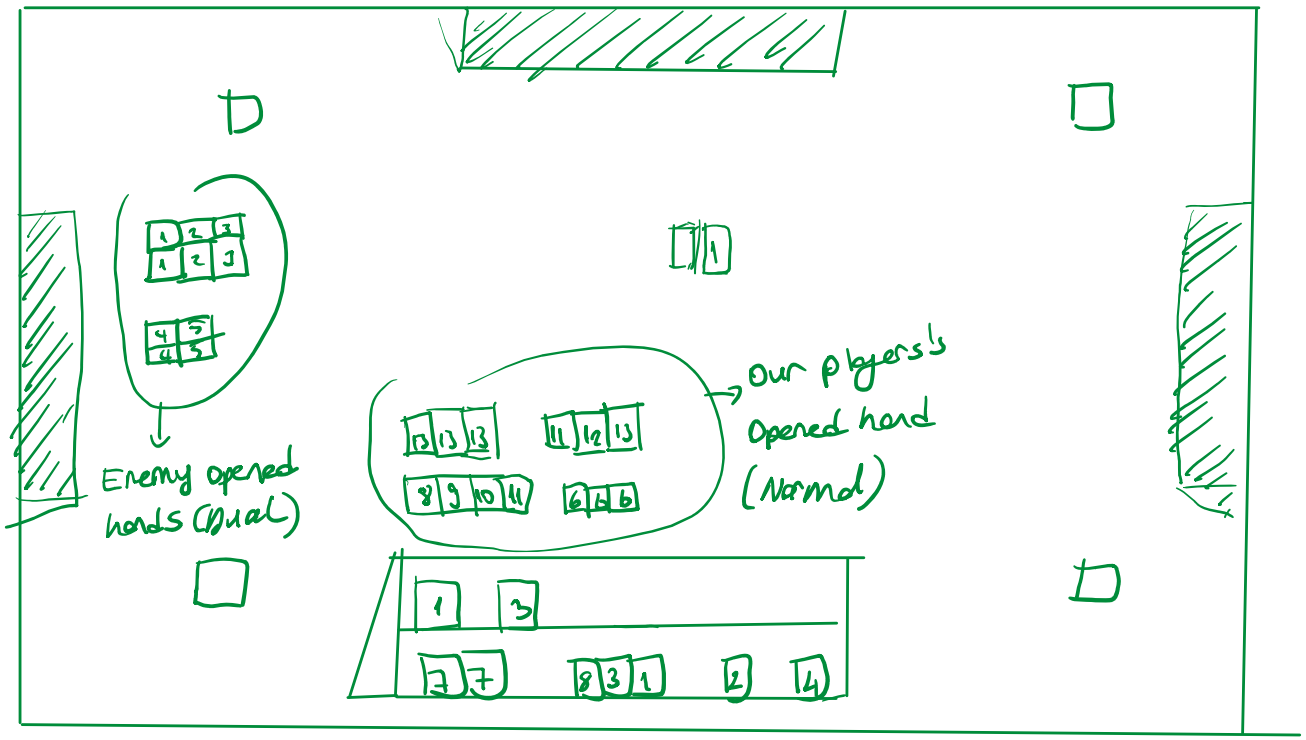
Last 3 stacks (1 identicator stack - cannot be dealed to players -, 2 passed stacks) are moved to center of the board. 20 tiles (3 stacks without identicator tile) are stacked up together. Identicator on its right, this is our draw tiles.

After dealing the tiles, game starts. Gaming board looks like this. (After some rounds) (No player opened up their hand yet)

(After some rounds)(No player opened up their hand yet)



If tile groups value exceed 101 or player has 5 couple tiles, they can open their hands.



Once a player exhausts the tiles on its Rack or Drawing stack is exhausted, round finishes.

Player rearranges its board by dragging the tiles

Player can rearrange its rack anytime it wants, but only melds its groups when it is its turn.

[illegible] sufficient, it not ask me questions.

I hope it is sufficent, it not ask me questions.
